Science Teaching 525

Survey of Geology

One Credit Hour

No Prerequisites (required course)

Instructor: Dr. William X. Chávez, Jr.
E-mail: wxchavez@nmt.edu
Office phone: (505) 835-5317

Course Designation: This course is required for students taking coursework in the geology and engineering areas within the MST program, and therefore has no prerequisites. All students in New Mexico Tech's MST Program must either take this course and pass it or successfully pass a challenge exam covering the content of this course.

Course Description: Students are introduced to some of the basic concepts of earth sciences, through both lecture format and field excursions. Structure of the Earth, geologic time, and sustainability of natural resources. Lectures and associated homework assignments provide students with the essentials of geology, seismology, and mineral resources studies.

Materials, Readings, and Resources: Because this is a course covering the fundamentals of earth and environmental sciences, a standard textbook that discusses geosciences is appropriate; however, suggested readings and background materials are provided within the lectures so that students may use internet search parameters to find appropriate information/answers for their assignments. In some assignments, students are requested specifically to search internet sources for background information, especially from university and college websites.

Course Content: Lectures and field trips emphasize the laws of geology, Earth structure, plate tectonics, and seismology, classification of rocks and minerals, and mineral resources and sustainability. Three essential areas are covered in this course.

1. Structure of the Earth: Lecture materials cover the tomographic setting of the Earth, seismology, and plate tectonics.

2. Rocks and Minerals: Classification of rocks, the Rock Cycle, and how rock characteristics are used to interpret Earth history; changes in the Earth over geologic time; Earth processes over time and the laws of geology.

3. Earth resources: The nature of Earth materials, mineral resource utilization and the environment, and sustainability of Earth resources; this latter lecture stresses the connection between Earth processes, the formation of mineral deposits, and the manners in which sustainability of natural resources may be achieved.

4. Field aspects of Geology: Two field trips are required as a part of this course, complementing the lecture series. These field trips are
directed at teaching students about those observations necessary to interpret Earth history - the history of rocks, and how that history is reflected in the Earth processes that continually shape and modify our planet.

**Course goals:** Because this course is appropriate for students having little or backgrounds in earth sciences it is expected that participants will finish the course having a grasp of earth processes, the nature of geologic time, and how earth materials are generated and used by society.

1. Students will gain a fundamental understanding of plate tectonics, plate motions and the means by which plates move, their interactions and resulting volcanic/seismologic consequences, and the history of the earth/geologic time.

2. This course will provide students with a background appropriate for continuation in (their) studies of earth sciences, geology, mining, and environmental sciences.

3. Because this course is also part of the evaluation of the student's current state of knowledge of geologic/earth science content when entering the MST Program, it is used to assess the general background of teachers in the New Mexico, and their general knowledge of physical sciences.

**Schedule:** Students are encouraged to e-mail/call the instructor with comments or questions regarding course assignments and content, and are also encouraged to discuss issues with their fellow students.

Three field trips are required for students participating in this course; these trips allow student-instructor contact, provide an open environment for questions and answers, and permit students to make first-hand observations of geologic phenomena.

Students are expected to complete this course within a single semester.

**Attendance:** Field trips are required attendance, and are offered at times when instructor and students surmise are appropriate.

Because adults tend to have family and work issues that may prevent them from attending a given field trip, students are permitted one missed trip; however, they are expected to “make up” the trip through completion of a substitute assignment. Students may proceed with lecture assignments at their own pace, although students are expected to complete the course successfully within one semester.

**Grading:** Grades are based on written homework assignments and field quizzes. Students may submit their assignments on paper or electronically; once submitted, assignments are graded with instructor comments and returned to the student for review. If a student has submitted a poorly-done assignment or if there is a question about what was expected for an assignment, the student is permitted to re-submit the homework for re-grading; in this way, students may learn from their efforts, and gain the knowledge necessary for continuance in other earth science/environmental science classes.

There are five essential homework assignments and at least two field-based assignments/quizzes. Each assignment is used in the grading process.
Assessment: Students taking this class are assessed according to their homework and in-field assignments.

Help: Students may help each other, and are strongly encouraged to work together. Although the instructor believes that collaboration is an important — if not fundamental — manner in which information is conveyed and digested, students are expected to perform their own work, and to contribute meaningfully to assignments in which discussions with other students are undertaken.

Internet sources of information are also made available to students, and students who find appropriate internet sources are encouraged to pass that information along to fellow students and the instructor.

The instructor is available for help via email and telephone, including at home. Individual/group requests for help can also be accommodated during field class meetings.

<tr>
<th>COMPETENCIES FOR ENTRY-LEVEL SCIENCE TEACHERS:</th>
<th>addresses competency</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Instruction and Assessment: Preparation to teach science shall involve:</td>
<td></td>
</tr>
<tr>
<td>(1) Inquiry, Including the Scientific Method</td>
<td>X</td>
</tr>
<tr>
<td>(a) Select and use a variety of instructional strategies and materials for teaching science meeting the needs of all students.</td>
<td>X</td>
</tr>
<tr>
<td>(b) Implement active inquiry based learning activities conducive to the development of scientific processes, critical thinking skills, and problem solving skills.</td>
<td>X</td>
</tr>
<tr>
<td>(c) Implement design technology/scientific method: identify a problem; propose a solution; implement proposed solutions; evaluate product or design; communicate a problem, design, and solution.</td>
<td>X</td>
</tr>
<tr>
<td>(d) Implement technology, including computers, interactive video, telecommunication, scientific instrumentation, and others.</td>
<td></td>
</tr>
<tr>
<td>(2) Content Integration</td>
<td>X</td>
</tr>
<tr>
<td>(a) Develop student understanding of the interconnectedness of the sciences and relate the major concepts of chemistry, earth and space science, physics, and biology to the teaching of science.</td>
<td>X</td>
</tr>
<tr>
<td>(b) Develop meaningful application of all content areas, including math, technology, language arts, social studies, and arts, in the delivery of science instruction.</td>
<td>X</td>
</tr>
<tr>
<td>(3) Designing and Managing Learning Environment</td>
<td></td>
</tr>
<tr>
<td>(a) Fulfill the professional and legal obligations of teaching.</td>
<td>X</td>
</tr>
<tr>
<td>(b) Incorporate the proper use of science tools, materials, media, and technological resources.</td>
<td>X</td>
</tr>
<tr>
<td>(c) Establish and maintain safety in all areas related to science instruction.</td>
<td>X</td>
</tr>
<tr>
<td>(d) Use and care for living organisms in an ethical and appropriate manner.</td>
<td></td>
</tr>
<tr>
<td>(4) Effective and Ongoing Assessment to Improve Student Learning</td>
<td>X</td>
</tr>
</tbody>
</table>
(a) Use assessment techniques such as performance testing, interviews, portfolios, and observations, for assessing student outcomes which are aligned with instruction and consistent with contemporary assessment.

(b) Use assessment tasks which may be appropriately modified to accommodate the needs of students with physical disabilities, learning disabilities, limited English proficiency, and cultural diversity.

**B. History and Nature of Science: Preparation to teach science shall include:**

1. Diversity and Human Endeavor
   - (a) Describe science careers and reasons why people choose science as a career, including the impact of culture, gender, and other factors.
   - (b) Describe the science contributions of people from a variety of social and ethnic backgrounds who have diverse interests, talents, qualities, and motivations.
   - (c) Develop student understanding of the relationships among science, technology, and cultural values.
   - (d) Recognize and respond to student diversity and encourage all students to participate fully in science learning.

2. Empirical Observation
   - (a) Explain that science distinguishes itself from other bodies of knowledge through the use of empirical standards, logical argument, and skepticism.
   - (b) Explain that scientific ideas depend on experimental and observational confirmation.

3. Historical Perspectives
   - (a) Understand that the body of scientific knowledge is continually being expanded and refined.
   - (b) Explain how theories and ideas throughout the history of science are refined or discarded as new evidence becomes available.
   - (c) Explain how Western, non-European, and New Mexican cultures have developed scientific ideas and contributed to scientific knowledge.

**C. Content Categories: The following areas are designed to allow potential science teachers to construct their pre-service education with an emphasis in one content area, while insuring they receive science education in any area which they might be required to teach. Preparation to teach science shall enable the teacher to understand and be able to teach within at least one of these emphases:**

1. Life Science Emphasis: All science teachers, grades K-12 will be able to identify and understand the relationship among major concepts and principles of biology, including anatomy, physiology, ecology, behavior of organisms, evolution, genetics, cell biology, microbiology, classification, and human biology.
   - (a) Teachers know and understand the characteristics that are the basis for classifying organisms.
(i) Teachers for grades K-4 will demonstrate an awareness of living things including basic cellular functions and processes, structures, the roles of organisms in systems comprised of living and non-living components and describe life cycles of plants and animals.

(ii) Teachers for grades 5-8 will use information about functions and cell structures to explain replication, reproduction, heredity, and disease, and categorize organisms based on methods of reproduction and offspring development.

(iii) Teachers for grades 9-12 will apply information about cell structures and functions to the world in which they live including understanding of DNA, RNA, natural selection processes, and diversity in plants and animals and use biological classifications to understand how organisms are related.

(b) Teachers will know and understand the synergy among organisms and the environments of organisms.

(i) Teachers for grades K-4 will explain how an organism's behavior is related to its physical environment; describe the roles of plants and animals in the flow of energy; describe how environmental pressures may accelerate changes in organisms; describe populations, communities, and systems; describe the impact humans have on the environment; understand natural resources (renewable versus non-renewable) and how each relates to humans' basic needs, and describe elements essential to good health.

(ii) Teachers for grades 5-8 will understand organisms' physical and behavioral adaptations and how changes occur over time; describe how organisms meet their needs, grow, and reproduce while sustaining stable local surroundings within an ever-changing larger environment; predict organisms' behaviors that may result from external stimuli; use information about variation and diversity to explain population changes over time; categorize organisms based on their roles within the ecosystem in which they live; examine the impact humans have on the living and non-living world including issues related to overpopulation; illustrate the relationships among renewable and non-renewable resources and population, and model responsible health practices including issues relating to nutrition and exercise.

(iii) Teachers for grades 9-12 will explain cellular responses to environmental threats to the organism ranging from the production of antibodies to changes in coloration; understand the pathways of energy within a living organism; predict an organism's behavioral responses to internal and external changes and to external stimuli as a function of inherited and acquired characteristics; create models that mimic a population's response to internal and external environment pressures; predict the impact humans might have on a species or system including resource depletion and over population, and interpret the relationships between personal choices and health.

(2) Physical Science Emphasis: All science teachers, grades K-12, will be able to identify and understand the relationships among chemistry concepts including organic, inorganic, analytical, physical, and biochemical and identify and understand the relationships among physical concepts including mechanics, electricity, magnetism, thermodynamics, waves, optics, atomic, and nuclear physics.

(a) Teachers will be able to know and understand the properties X
of matter.

(i) Teachers for grades K-4 will describe the observable properties of common items and substances and explain that elements are the basic units of all matter.

(ii) Teachers for grades 5-8 will identify the properties of elements and compounds such as density, boiling point, and solubility and that these characteristics are independent of amount of the sample and articulate that chemical reactions occur in a predictable fashion and that the formation of compounds adheres to imperatives as conservation of matter.

(iii) Teachers for grades 9-12 will compare and contrast elements and compounds based upon the knowledge of the atomic/subatomic structures of matter and predict how atoms interact based upon sharing or transference of outer electrons.

(b) Teachers will know and understand the properties of fields, forces, and motion.

(i) Teachers for grades K-4 will describe how an object may be described with regard to its relative position to other objects; explain that an object's motion may be described by indicating change over time and describe how the earth's gravity pulls objects toward it.

(ii) Teachers for grades 5-8 will illustrate how Newton's Laws describe objects in motion; describe quantitatively how an object's position, speed and motion explain motion and compare and contrast forces affecting the physical world.

(iii) Teachers for grades 9-12 will apply knowledge of the constancy of energy in the universe and the forms that energy take in daily life; predict the motion of an object based on the net applied force applied to the object and explain and graphically describe that a specific mass exerts a force on others masses (velocity and acceleration).

(c) Teachers will know and understand the concepts of energy and energy transformation.

(i) Teachers in grades K-4 will describe the basic characteristics of light, heat, sound, and electromagnetism, and explain that energy exists in many forms and can be transformed and describe the process of chemical reactions and how time is a factor in chemical reactions.

(ii) Teachers in grades 5-8 will apply knowledge of energy and energy transformation to science problems; explain how chemical reactions can take place over periods of time and explain how concentration, pressure, temperature, and catalysts may affect chemical reactions.

(iii) Teachers in grades 9-12 will demonstrate their understanding of energy by identifying examples of transformations within and outside the school environment and devise scientific investigations demonstrating the impact of temperature and other variables on chemical reactions.

(3) Earth and Space Science Emphasis: All science teachers, grades K-12, will know and understand properties of earth and space science.
(a) Teachers in grades K-4 will describe the physical and chemical properties of earth's materials and the states of matter; describe the uses of earth's materials as resources and the sun as the major source of energy; describe changes in the earth's surface; describe changes in weather; recognize that fossils provide a record of animals and plants that lived long ago; represent the school and local community using symbols and maps; describe basic components of and movements within the solar system; identify the types of instruments and vehicles used for space exploration and describe human's movement toward space from early observations to recent explorations.

(b) Teachers in grades 5-8 will explain how earth's materials can be transformed from one state to another; experiment with earth's materials using them as resources; model natural resources that shape the earth's surface; observe, measure, and record weather changes; explain how fossils are formed and how fossils provide evidence of complexity and diversity over time; use rectilinear coordinate systems such as latitude and longitude to locate points on the earth's surface; describe the interactions among the earth's lithosphere, hydrosphere, atmosphere, and biosphere; explain simple data derived from recent remote and direct observations in the solar system and space beyond; model the predictable patterns of the sun and planets in the solar system and cite benefits from continued exploration of space.

(c) Teachers in grades 9-12 will evaluate information about earth's materials, energy, and geochemical cycles; model the interaction between the earth's internal and external energy sources; use tectonic theory to predict changes in the earth's surface; model weather patterns and other natural cycles related to the movement of matter driven by the earth's internal and external sources of energy; use fossil and other evidence to investigate how the earth changes; extend mapping techniques to learning in science and other content areas; explain the evolution of earth in terms of the interactions among the geosphere, hydrosphere, atmosphere, and biosphere; model interactions between components of the earth based on the understanding of the earth as a system containing a fixed amount of each stable chemical or element; trace the development of space exploration and discuss how recent missions impact understanding of the earth; evaluate the hierarchy of structures in the universe from atoms to galaxies and identify the pros and cons of various scientific theories for the origin of the universe based on scientific evidence.

(4) Environmental Science Emphasis: All science teachers, grades K-12, will be able to identify and apply major concepts of environmental science such as ecosystems, energy flow, population ecology, natural resources, meteorology, geology, oceanography, and conservation.

D. Environmental, Personal and Social Implications: Preparation to teach science shall enable teachers to understand and be able to teach:

(1) Personal, community, New Mexico and global environmental issues;

(2) The approaches to evaluate the ethical implications of new developments in science;

(3) Personal and community health issues;
(4) Decision-making and value-analysis skills for investigating science-related societal problems;

(5) Ethical use and care of living organisms.

E. Professionalism: Teacher education programs shall develop reflective practitioners who:
